United States Department of Energy

Revolutionizing Power Production & Use

SECA as a key part of DOE's Strategy to Reduce Electrical Energy Losses

Current Technology

Coal Generation

35% Efficiency
(65% Loss)

Transmission & Distribution

31% Efficiency
(11% Loss)

End-Use Light

4% Efficiency
(87% Loss)

DOE Programs for Tomorrow

Coal Generation

60% Efficiency
(40% Loss)

SMART GRID

55% Efficiency
(8% Loss)

Solid-State Lighting

>40% Efficiency
(27% Loss)

SECA and other DOE programs can realistically increase end-use efficiency by more than 10x! (from 4 to >40)

FY 10 Fossil Energy Fuel Cell Program Solid State Energy Conversion Alliance (SECA)

Core Technology Program

NATIONAL ENERGY TECHNOLOGY LABORATORY

Intellectual Property

Cornerstone of the Alliance

- Promotes Collaboration – Industry knows it will benefit
- Limits Research Redundancy – Less Government Dollars
- Technology in best designs – Technology isn't "locked up"

OMB cited SECA as Leading the Way in Government-Industry Partnerships

- The Office of Management and Budget cited the SECA program as leading the way in Government-industry partnerships. *“The SECA program leverages private-sector ingenuity by providing Government funding to Industry Teams developing fuel cells, as long as the Teams continue to exceed a series of stringent technical performance hurdles. This novel incentive structure has generated a high level of competition between the Teams and an impressive array of technical approaches. The SECA program also develops certain core technologies that can be used by all the Industry Teams to avoid duplication of effort. The program exceeded its 2005 performance targets, and it is on track to meet its goal for an economically competitive technology by 2010.”*

Driving Down Costs For Fuels Cells⁽¹⁾

(Order of Magnitude Cost Reduction)

>\$1500/kW (2000)

How Big are the U.S. Markets? Coal

SECA Fuel Cells available for installation in 2018

New Coal Capacity, 2018 – 2030.....110 GW

Average SECA Fuel Cell Production 9.2 GW/yr

EIA Annual Energy Outlook (AEO) for 2007 pp. 82-83

DOE's Office of Fossil Energy

Advanced (Coal) Power Systems Goals

- 2010:
 - 45-50% Efficiency (HHV)
 - 99% SO₂ removal
 - NO_x < 0.01 lb/MM Btu
 - 90% Hg removal
- 2012:
 - 90% CO₂ capture
 - <10% increase in COE with carbon sequestration
- 2015
 - Multi-product capability (e.g, power + H₂)
 - 60% efficiency (measured without carbon capture)

Solid State Energy Conversion Alliance Performance Assessment Rating Tool (OMB) 2010

Stack Cost ~ \$175/kW stack

Capital Cost < \$700/kW system

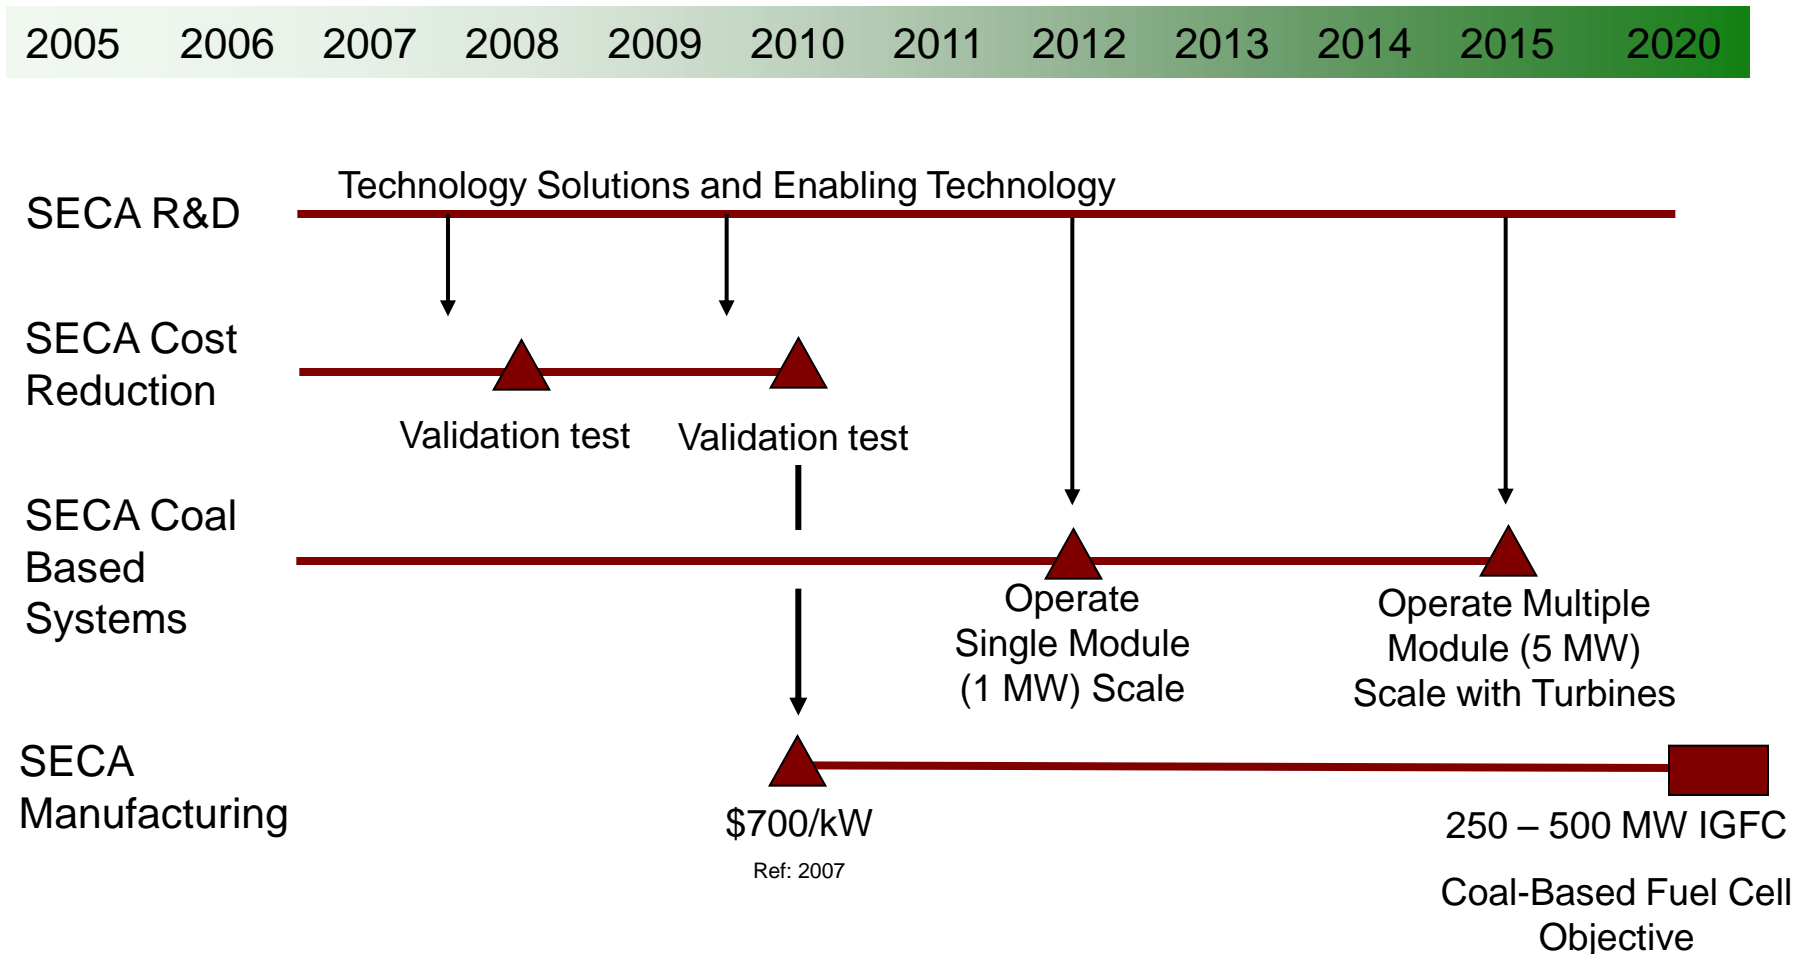

**Maintain Economic Power Density with
Increased Scale ~ 300mW/cm²**

Ref: 2007
Goal: 2010

**Mass customization – stacks used in multiple
applications....large and small systems**

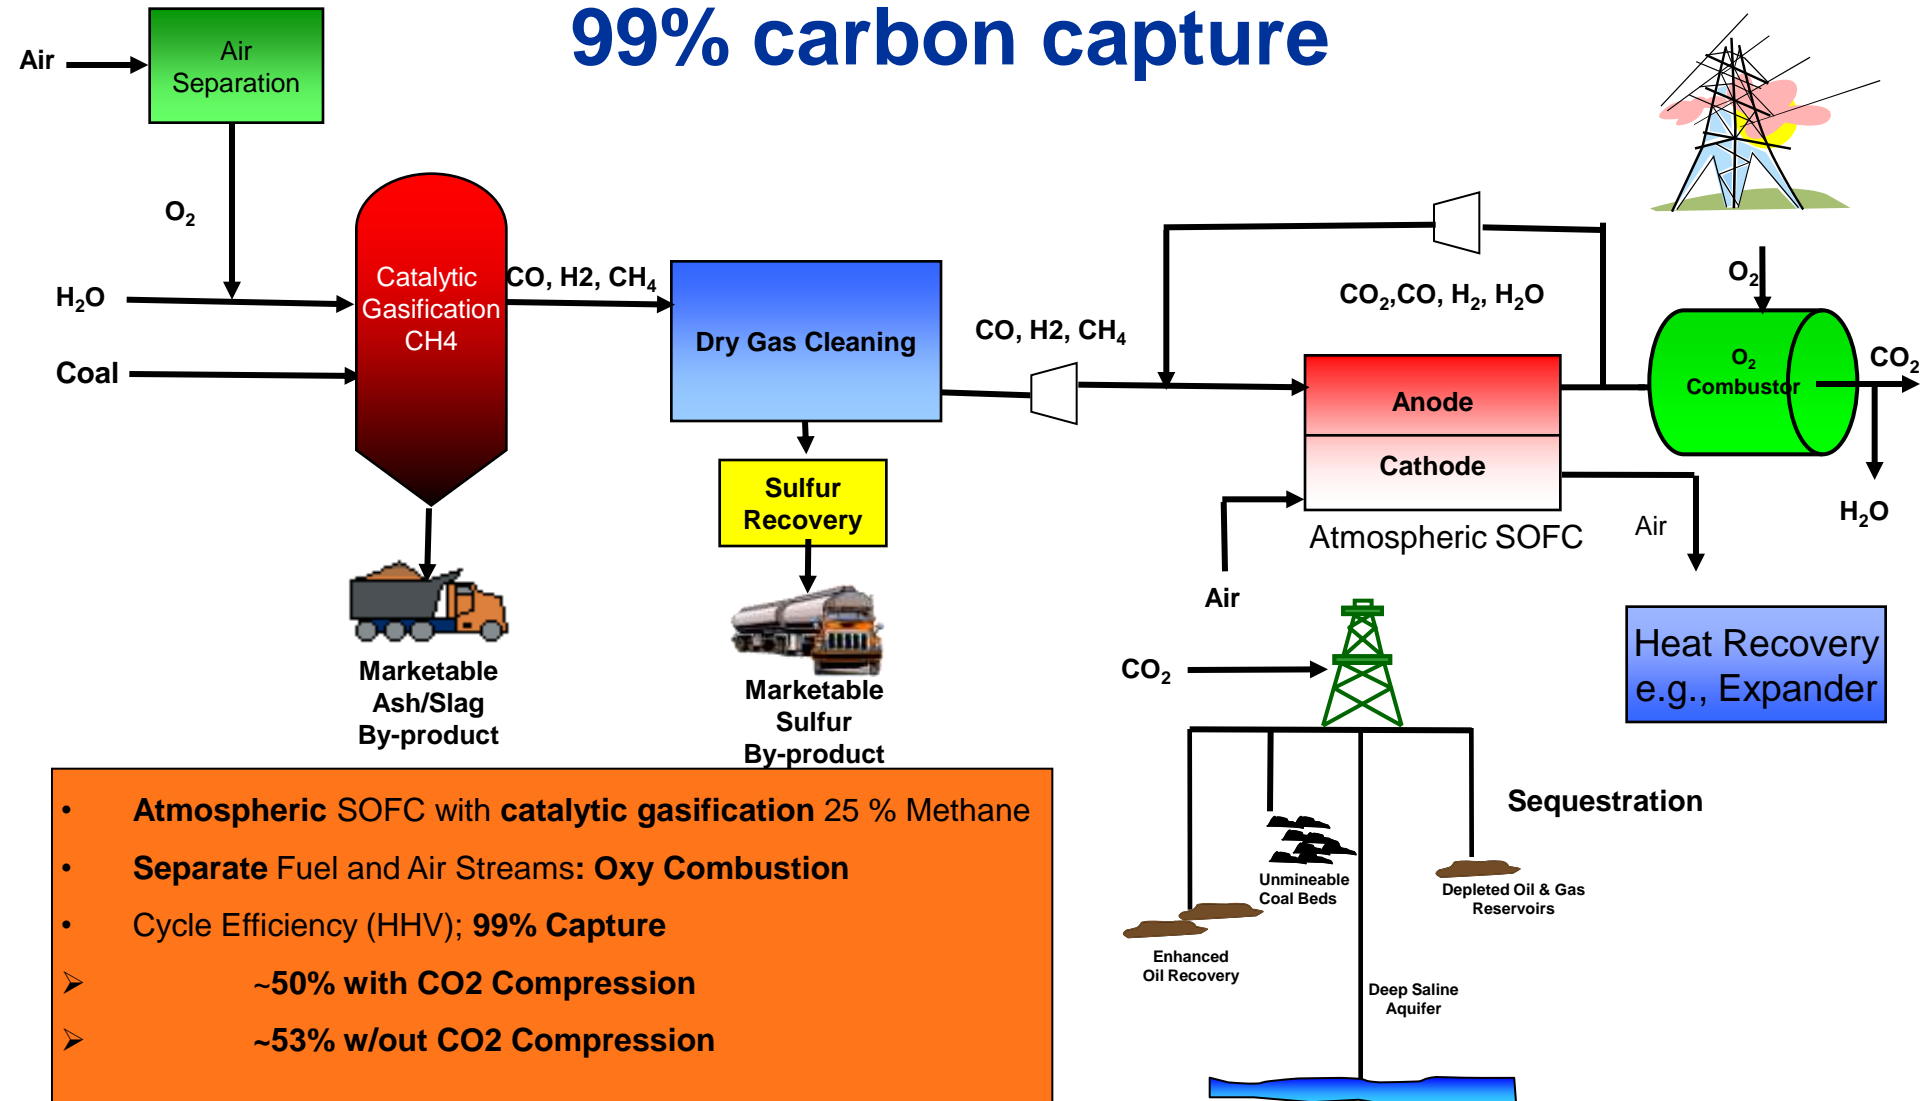

Solid State Energy conversion Alliance Fuel Cells Technology Timeline

SECA Coal Based Systems

near-zero water requirement

99% carbon capture

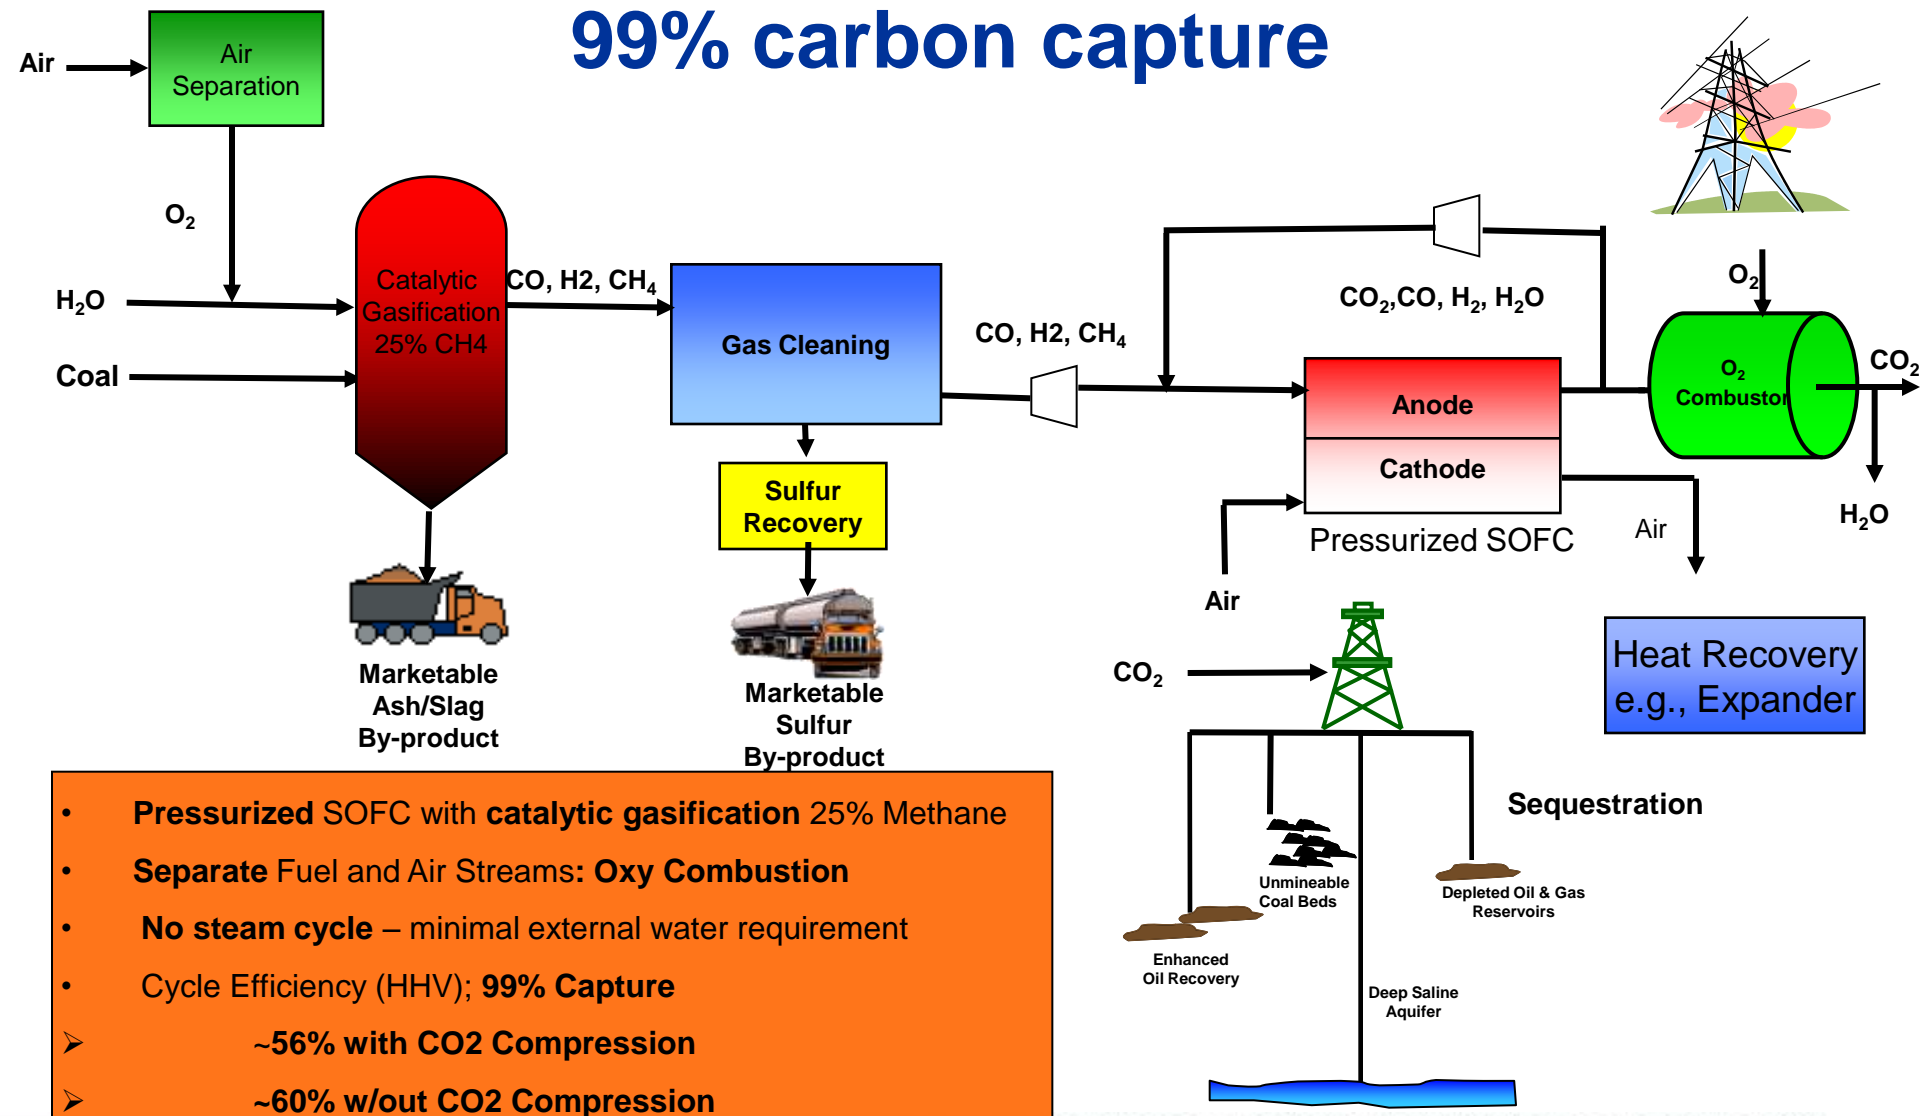

- **Atmospheric SOFC with catalytic gasification 25 % Methane**
- **Separate Fuel and Air Streams: Oxy Combustion**
- **Cycle Efficiency (HHV); 99% Capture**
 - ~50% with CO_2 Compression
 - ~53% w/out CO_2 Compression

SECA Coal Based Systems

near-zero water requirement

99% carbon capture

- **Pressurized SOFC with catalytic gasification 25% Methane**
- **Separate Fuel and Air Streams: Oxy Combustion**
- **No steam cycle** – minimal external water requirement
- Cycle Efficiency (HHV); **99% Capture**
 - ~56% with CO_2 Compression
 - ~60% w/out CO_2 Compression

Key Points

- 25% Methane
- +
- Pressure

*60% Efficiency
HHV*

- Separate Air & Fuel Streams / no Steam Plant

➤ 99 % Carbon Capture

➤ Near Zero Water Use

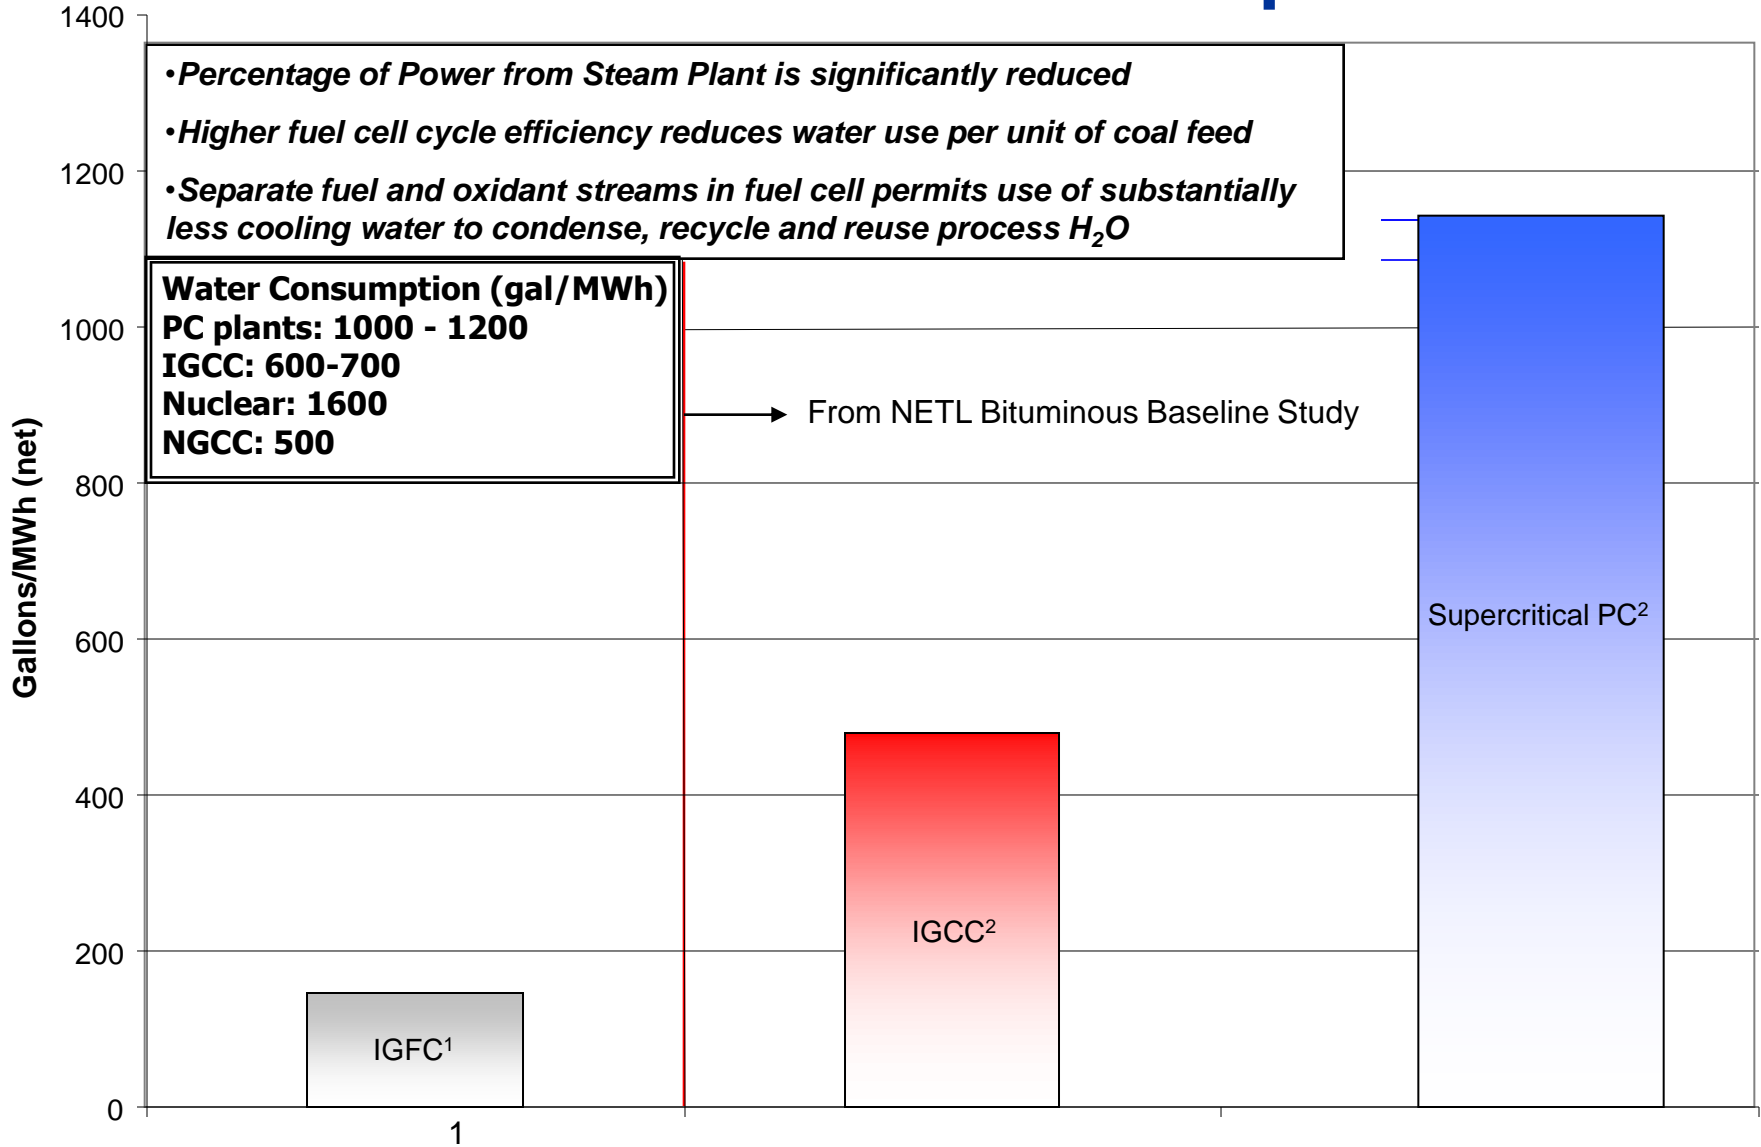

➤ < 0.5 ppm NO_x

Impact of Efficiency on COE

Advanced Power Systems With CO2 Capture, Compression and Storage					
	PC Baseline	IGCC Baseline		IGFC Atmos.	IGFC Press.
Efficiency HHV (%)	27.2	32.5		50.0	57.3
Capital Cost \$/kW	2,870	2,390		1,991	1,667
Steam Cycle % Power	100	37		26	2
Cost-of-Electricity ¢/kW-hr	11.6	10.6		8.5	7.3

The Benefit of SOFC for Coal Based power Generation, Report Prepared for U. S. Office of Management and Budget, 30OCT07

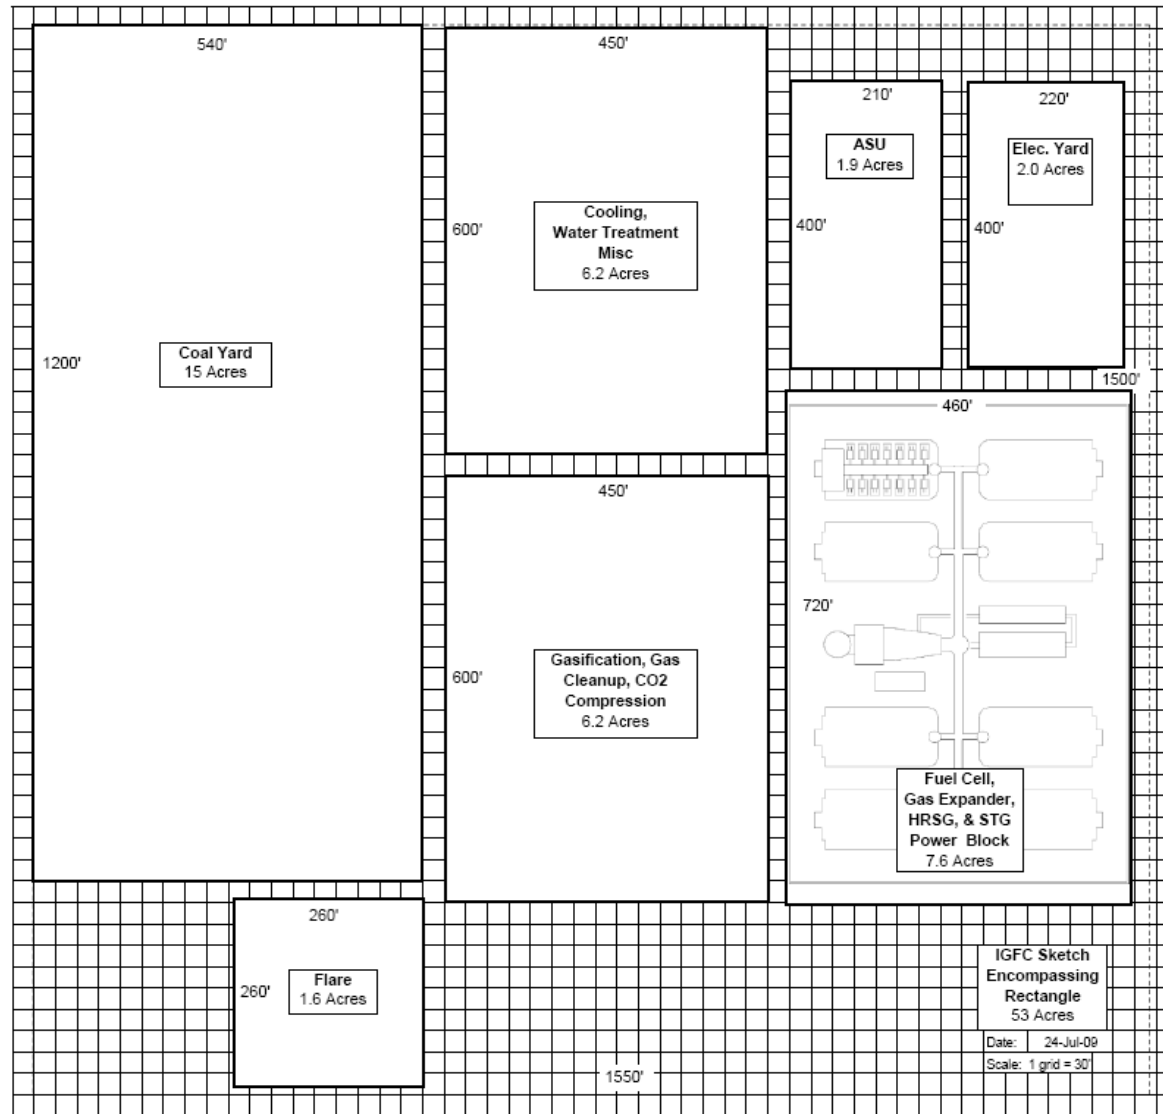

Raw Water Withdrawal Comparison

¹ System includes 100% carbon capture and CO₂ compression to 2,215 psia

² System includes 90% carbon capture and CO₂ compression to 2,215 psia

IGFC Plot Plan

Provided by:

WorleyParsons

resources & energy

NATIONAL ENERGY TECHNOLOGY LABORATORY

Preliminary Footprint Comparison: IGFC : IGCC

IGFC [Integrated Gasification Fuel Cell Cycle]

IGCC [Integrated Gasification combined Cycle]

- IGFC process area size reduction associated with the increased plant efficiency (coal yard, ASU, gasification, syngas cleanup, CO₂ compression, cooling system)
- IGFC process area size increases (power block)
- IGFC process areas is independent (electric switchyard, general services, parking, laydown)

Plant Capacity – 500 MW	IGCC	IGFC
Preliminary Foot Print	Range: 50 -100 acres	~53 acres Range: 50-100 acres

Conclusion: IGCC and IGFC will be comparable in real estate requirement.

Electronic Effect versus Defect Chemistry

SECA Solid Oxide Fuel Cells

SECA systems can produce power from any commercial fuel

Convergence of Power Demand, High Power Cost, Grid Constraints & Environmental Factors Drive Early Adopters

SECA U.S. Markets/Distributed Generation

7 GW/yr

	Power Range	Units per year	Total (GW/yr)
Remote Generators	3-10 kW	30,000	0.195
Telecommunications	3-10 kW	30,000	0.195
Commercial/Industrial	1 – 5 MW	1,000	3.0
Back-up Power	5 – 250 kW	10,000	1.27
Auxiliary Power Units (Trucks)	5-15 kW	200,000	2.0
Annual Capacity			6.6

Peterbilt/Delphi Auxiliary Power Unit

Commercial in 2012

Pathway to Coal Plants

•Development Similar to Computer Commercialization

Central Main Frame > Small Laptop > Large Parallel Computing

Fuel Cells: 200kW (1990's) to 5kW (2007) to 5MW (2015) to 500 MW (2020)

•Develops Infrastructure for Fuel Cell Stack Manufacture

- Delphi's diesel SECA APU powered the Peterbilt Model 386's electrical hotel loads, including air-conditioner, radio, CB, lights, battery, & start-up.
- The Delphi SECA APU addresses anti-idling regulations by reducing idling emissions. (30% efficiency versus 7% for primary engine)

SOFCs in Unmanned Undersea Vehicles (UUVs)

21UUV (2-5 kW)

- Fisher-Tropsch
- SECA Stacks and Blower

- Naval Undersea Warfare Center, Division Newport, (NUWCDIVNPT) successfully tested SECA SOFCs in extreme conditions. Used SECA Stacks (2 Developers) and SECA developed High Temperature Blower
- SOFC technology has the potential to greatly increase UUV mission time compared with current battery technology.
- Although SECA has a coal-based, central generation focus, spin-off applications are encouraged. Military applications like UUVs provide operating experience and independent validation for SECA.
- Cost and operational lifetime are not necessarily major concerns for military applications, as long as new mission capability can be delivered.
